OBSOLETE SYNTAX

Shebang

Use `#!/usr/bin/env bash` instead of `#!/bin/bash`.

- The former searches the user's PATH to find the bash binary.
- The latter assumes it is always installed to `/bin/` which can cause issues.

NOTE: There are times when one may have a good reason for using `#!/bin/bash` or another direct path to the binary.

```
# Right:

    #!/usr/bin/env bash

# Less right:

    #!/bin/bash
```

Command Substitution

Use `$()` instead of `` ` ` ``.

```
# Right.
var="$(command)"

# Wrong.
var=`command`

# $() can easily be nested whereas `` cannot.
var="$(command "$(command)")"
```

Function Declaration

Do not use the `function` keyword, it reduces compatibility with older versions of bash.

```
# Right.
do_something() {
    # ...
}

# Wrong.
function do_something() {
    # ...
}
```
